

# MANAGE

## Liberate your world view from files & folders

United we understand, divided we sort, click and scroll

Back in the day when all human knowledge could be written within the pages of a Sunday NY Times, “scrolling” though pages of text – whether written on an actual papyrus scroll, paper or a word document – would be a fine way to spend one’s day. Today, you face huge grids of numbers, stacks of reports and lists of news links you simply don’t have time to read.

Quantum4D provides a more efficient medium to fuse the meaning previously divided between numeric form (charts and spreadsheets) and qualitative form (structure and relations). Rather than chop up your world on 2D slices only to need to reconstruct what it all means in your head, why not create a visual model of how everything interconnects and then feed and animate your raw data and news onto those structures. You’ll end up smarter faster.

### Attributes

The next time you copy and paste a row or column from one spreadsheet to the next... remember that you are now officially on notice that you are needlessly wasting your time. There is now a better way to manage your data flow.

Quantum4D lets map data to views on the fly with a few clicks. *Once it's in the model you and others can reconfigure on fly through variations and save to share new views!*

### Lenses

The charts you view daily slice your world up into nice thin views to fit on paper. But they also leave you endlessly clicking to reconfigure, update, compare and re-publish the results as new charts that become outdated the next day.

Quantum4D gives you dynamic interactive update-ability on thirty or more series... *in the screen space of one chart.*

### Spaces

Besides giving you more dimensions to see your data, workspaces don't divide your data like files do. You could theoretically connect every single report and spreadsheet you have on your computer in one interconnected model.

Quantum4D ends the time/money bleed that is life in file & folders. *Remember that the next time you look for a file.*

### Events

Upstream? Downstream? What news is going to flood or dam your profit flow?

Quantum4D let's you see the currents in the river of news better. *Cast your attention better where it counts.*

### Relations

Today, you either simply ignore relationship structures in your world or you are dealing with matrices in spreadsheets. If you've seen them you know matrices are one of the ugliest sheets of data you'll ever see.

Quantum4D reveals relationships to be truly very beautiful. *You should listen more closely to your relationships.*
