

MONITOR

See more data and news more effectively

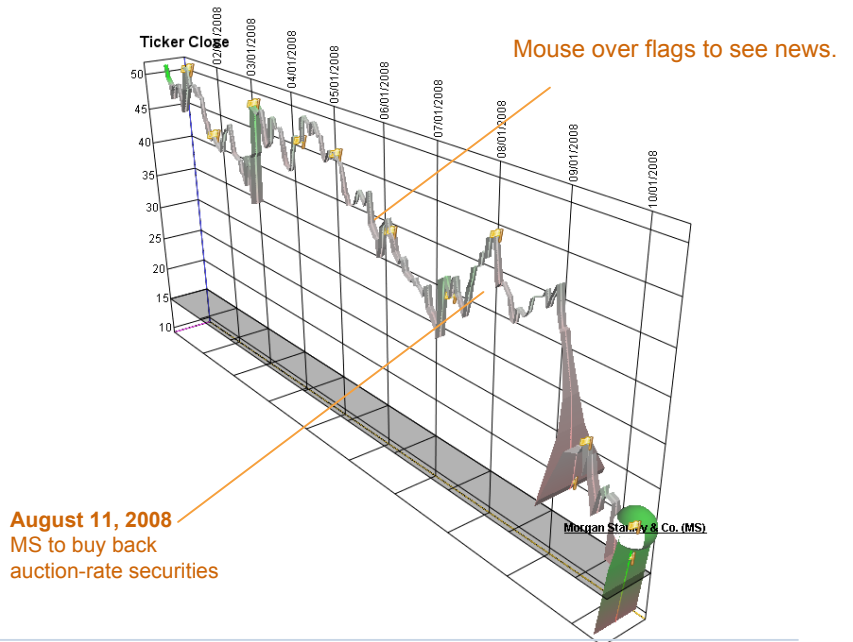

Market news is seamlessly combined with numeric data analysis work flow

See the why's driving the what's

Quantum4D lets you associate a growing list of news feeds with one or more persistent queries associated with any object anywhere in your model. These feeds can be used in the following ways:

- during **animation** – to show the 'why' behind the 'what is happening?'
- as a trigger for **alerts** – either key word or news volume driven.

Once you've created your queries, simple refresh your views to get the latest data as you navigate through your spaces or those created by other members of your team.

Create alert systems and behavior monitoring dashboards

Quantum4D allows you to create visual models that articulate the structure of information associated with your concern. Here a user has created a 'country ontology' covering major topics that make up the sectors and domains of a country. Each branch represents a query set by the user with thresholds set to alert them if the volume of new or key words trigger the search.

Registered users can view this space and many more live examples in our hosted Metabase.

We invite you to try **Quantum4D** for yourself by registering an account today.
